html elements correspond to, and are in same order as, the elements of the "accounts" array returned by get / data. name text corresponds to the "name" property in each array element.

```
onclick() {  
  if ( ! "name".empty() && ! "initial balance".empty() ) {  
    publicKey = xhr( post /account, name, balance );    // see http spec for payload format  
    remove "create new account" dialog;  
    add new element to bottom of center box with "name";  
  } else {  
    display error popup: "'name' and 'initial balance' must be specified";  
  }  
}
```

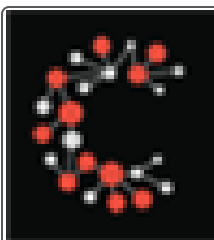

# contracts

```
onclick() {
  if ( payment element selected && session element selected ) {
    xhr( post /contract, paymentName, sessionName, paymentArgs, sessionArgs );
  } else {
    display error popup: 'payment and session contracts must be specified';
  }
}
```

```
onclick() {
  if ( ! "name".empty() && file.selected() ) {
    read specified file;
    wasm = base64 encode file contents;
    xhr( post /contract, name, type, wasm ); // type is "payment" or "session"
    add new element to bottom of relevant type box with "name";
  } else {
    display error popup: "'name' and file must be specified';
  }
}
```
